

Urban Naturalist Supplemental File

Kempf, J.K., B.J. Adams, and B.V. Brown. 2021. Urban spider diversity in Los Angeles assessed using a community science approach. *Urban Naturalist* 40:1–10.

Supplemental Table 1. A list of all spiders identified from the Los Angeles Spider Survey and other associated collections. Included are all identified spider families, genera, species, and morphospecies with authority for the species (authority for genus is used in the case of morphospecies). Individual abundances are provided for total collections. When possible, abundance data are also provided for spiders identified to male or female, and spiders which were located either indoors or outdoors. Urban includes the spiders collected as part of the LASS survey; SMMRNA includes spiders collected during museum surveys and by Field Entomology classes; Desert includes spiders collected at the Santa Rosa Plateau, Fort Irwin, and the Burns Pi-non Ridge Reserve; and Other includes spiders collected at the Placerita Canyon Nature Area and the James San Jacinto Mountains Reserve.

Note: The content of supplemental files is not subject to proof editing by the journal staff. Thus, the responsibility for the accuracy of all information and correctness of its presentation in this file lies solely with the author(s).

note: Taxa cited as "Genus" sp. are unidentified specimens of that genus, that we were not successful in identifying. They are not (necessarily) different species from others in their genus, and are therefore not counted in species counts (except for those that are the only representatives of their genera)
